#### Abstract

: This paper focuses on finding non-zero distinct integer solutions to the nonhomogeneous ternary bi-quadratic diophantine equation given by $x z(x-z)=y^{4}$. Different sets of integer solutions are presented.

Key words: non-homogeneous bi-quadratic, ternary bi-quadratic ,integer solutions

Notations:

$$
\begin{aligned}
& \mathrm{t}_{\mathrm{m}, \mathrm{n}}=\mathrm{n}\left(1+\frac{(\mathrm{n}-1)(\mathrm{m}-2)}{2}\right), \mathrm{P}_{\mathrm{n}}^{3}=\frac{\mathrm{n}(\mathrm{n}+1)(\mathrm{n}+2)}{6}, \mathrm{P}_{\mathrm{n}}^{5}=\frac{\mathrm{n}^{2}(\mathrm{n}+1)}{2} \\
& \mathrm{P}_{\mathrm{n}}^{4}=\frac{\mathrm{n}(\mathrm{n}+1)(2 \mathrm{n}+1)}{6}, \mathrm{CP}_{\mathrm{n}}^{4}=\frac{\left(2 \mathrm{n}^{3}+\mathrm{n}\right)}{3}, \mathrm{CP}_{\mathrm{n}}^{12}=2 \mathrm{n}^{3}-\mathrm{n}
\end{aligned}
$$

Introduction:
The Diophantine equations are rich in variety and offer an unlimited field for research [1-4]. In particular refer [5-28] for a few problems on Biquadratic equation with 3 unknowns. This paper concerns with yet another interesting Biquadratic Diophantine equation with three variables given by $\mathrm{xz}(\mathrm{x}-\mathrm{z})=\mathrm{y}^{4}$ for determining its infinitely many non-zero distinct integral solutions.

Method of analysis:
The non-homogeneous ternary bi-quadratic equation under consideration is

$$
\begin{equation*}
x z(x-z)=y^{4} \tag{1}
\end{equation*}
$$

International Research Journal of Education and Technology

Introduction of the linear transformations

$$
\begin{equation*}
x=u+v, z=u-v, y=2 v, u \neq v \neq 0 \tag{2}
\end{equation*}
$$

in (1) leads to

$$
\mathrm{u}^{2}=\mathrm{v}^{2}(1+8 \mathrm{v})
$$

which is satisfied by

$$
\mathrm{v}=\frac{\mathrm{n}(\mathrm{n}+1)}{2}, \mathrm{u}=\frac{\mathrm{n}(\mathrm{n}+1)(2 \mathrm{n}+1)}{2}
$$

In view of (2), the corresponding integer solutions to (1) are given by

$$
\begin{equation*}
\mathrm{x}=\mathrm{n}(\mathrm{n}+1)^{2}, \mathrm{z}=\mathrm{n}^{2}(\mathrm{n}+1, \mathrm{y}=\mathrm{n}(\mathrm{n}+1) \tag{3}
\end{equation*}
$$

A few interesting relations among the solutions are exhibited below:
(i). $x+z=6 P_{n}^{4}$
(ii). $x+y+z=12 P_{n}^{3}-4 t_{3, n}$
(iii). $\mathrm{x}+\mathrm{z}-3 \mathrm{CP}_{\mathrm{n}}^{4}$ is a square multiple of 3
(iv). $\mathrm{x}+\mathrm{z}-\mathrm{CP}_{\mathrm{n}}^{12} \equiv 2(\bmod 3)$
(v). $\mathrm{x}+\mathrm{z}-\mathrm{CP}_{\mathrm{n}}^{12}-\mathrm{t}_{8, \mathrm{n}} \equiv 0(\bmod 4)$
$(\mathrm{Vi})$.Each of the following is a perfect square:

$$
\frac{\mathrm{yx}}{\mathrm{z}}, \frac{\mathrm{zx}}{\mathrm{y}}, \frac{\mathrm{zy}}{\mathrm{x}}
$$

(Vii). $x-y=2 P_{n}^{5}$
(Viii). $z-y=6 P_{n-1}^{3}$
(IX). $x^{2}-z^{2}=12 P_{n}^{4} * t_{3, n}$
(X). $x+y+z-3 C P_{n}^{4}-t_{10, n} \equiv 0(\bmod 4)$

It is worth mentioning that, apart from (2), one may employ other choices of linear
transformations leading to different sets of solutions. For simplicity and brevity, we present below a few sets of solutions to (1):

Set 1:

$$
\mathrm{x}=(\mathrm{k}+8)\left(\mathrm{k}^{2}-64\right), \mathrm{z}=(\mathrm{k}-8)\left(\mathrm{k}^{2}-64\right), \mathrm{y}=2\left(\mathrm{k}^{2}-64\right)
$$

Set 2:

$$
\mathrm{x}=(5 \mathrm{k}-1)\left(75 \mathrm{k}^{2}-75 \mathrm{k}+12\right), \mathrm{z}=(5 \mathrm{k}-4)\left(75 \mathrm{k}^{2}-75 \mathrm{k}+12\right), \mathrm{y}=\left(75 \mathrm{k}^{2}-75 \mathrm{k}+12\right)
$$

Set 3:

$$
\mathrm{x}=(\mathrm{k}-128)(\mathrm{k}+128)^{2}, \mathrm{z}=(\mathrm{k}+128)(\mathrm{k}-128)^{2}, \mathrm{y}=4\left(\mathrm{k}^{2}-128^{2}\right)
$$

Set 4:

$$
\mathrm{x}=(3 \mathrm{k}+3)\left(45 \mathrm{k}^{2}+15 \mathrm{k}-30\right), \mathrm{z}=(3 \mathrm{k}-2)\left(45 \mathrm{k}^{2}+15 \mathrm{k}-30\right), \mathrm{y}=\left(45 \mathrm{k}^{2}+15 \mathrm{k}-30\right)
$$

Set 5:

$$
\mathrm{x}=\left(45 \mathrm{k}^{2}+45 \mathrm{k}-20\right)(3 \mathrm{k}+4), \mathrm{z}=\left(45 \mathrm{k}^{2}+45 \mathrm{k}-20\right)(3 \mathrm{k}-1), \mathrm{y}=\left(45 \mathrm{k}^{2}+45 \mathrm{k}-20\right)
$$

Conclusion:
An attempt has been made to obtain non-zero distinct integer solutions to the nonhomogeneous bi-quadratic diophantine equation with three unknowns given by $x z(x-z)=y^{4}$ .One may search for other sets of integer solutions to the considered equation as well as other choices of the fourth degree diophantine equations with multi-variables
