#### Abstract

: The homogeneous ternary quadratic diophantine equation given by $z^{2}=63 \boldsymbol{x}^{2}+\boldsymbol{y}^{\mathbf{2}}$ is analyzed for its non-zero distinct integer solutions through different methods. A few interesting properties between the solutions are presented. Also, formula for generating sequence of integer solutions based on the given solutions are presented.

Keywords:Ternary quadratic, Integer solutions, Homogeneous cone.

## Notation:

$$
t_{m, n}=n\left[1+\frac{(n-1)(m-2)}{2}\right]
$$

## Introduction:

It is well known that the quadratic diophantine equations with three unknowns(homogenous (or) non-homogenous) are rich in variety [ 1,2 ]. In particular, the ternary quadratic diophantine equations of the form $z^{2}=D x^{2}+y^{2}$ are analyzed for values of $D=29,41,43,47,61,67$ in [ 3-8]. In this communication, the homogeneous ternary quadratic diophantine equation given by $z^{2}=63 x^{2}+y^{2}$ is analyzed for its non-zero distinct integer solutions through different methods. A few interesting properties between the solutions are presented. Also, formulas for generating sequence of integer solutions based on the given solutions are presented.

International Research Journal of Education and Technology ISSN 2581-7795

## METHOD OF ANALYSIS

The ternary quadratic diophantine equation to be solved for its integer solutions is

$$
\begin{equation*}
z^{2}=63 x^{2}+y^{2} \tag{1}
\end{equation*}
$$

We present below different methods of solving (1)

## Method:1

(1) is written in the form of ratio as

$$
\begin{equation*}
\frac{z+y}{9 x}=\frac{7 x}{z-y}=\frac{\alpha}{\beta}, \beta \neq 0 \tag{2}
\end{equation*}
$$

which is equivalent to the system of double equations

$$
\begin{aligned}
& 9 \alpha x-\beta y-\beta z=0 \\
& 7 \beta x+\alpha y-\alpha z=0
\end{aligned}
$$

Applying the method of cross-multiplication to the above system of equations, one obtains

$$
\begin{aligned}
& x=x(\alpha, \beta)=2 \alpha \beta \\
& y=y(\alpha, \beta)=9 \alpha^{2}-7 \beta^{2} \\
& z=z(\alpha, \beta)=9 \alpha^{2}+7 \beta^{2}
\end{aligned}
$$

which satisfy (1)

## Properties:

- $2[y(\alpha, 1)+z(\alpha, 1)]=9 x^{2}(\alpha, 1)$
- $8\left[y^{3}(\alpha, 1)+z^{3}(\alpha, 1)+108 y(\alpha, 1) z(\alpha, 1) x^{2}(\alpha, 1)=729 x^{6}(\alpha, 1)\right.$
- $2[y(\alpha, 1)+z(\alpha, 1)]-17 x(\alpha, 1)-t_{72, \alpha}$ is a perfect square.
- $y(\alpha, 1)-t_{20, \alpha} \equiv 1(\bmod 8)$
- $9 y(\alpha, 1)-t_{164, \alpha} \equiv 17(\bmod 80)$
- $y(\alpha, 1)+z(\alpha, 1)-36 t_{3, \alpha} \equiv 4(\bmod 18)$

## Note: 1

It is observed that (1) may also be represented as below:

$$
\text { (i) } \frac{z+y}{7 x}=\frac{9 x}{z-y}=\frac{\alpha}{\beta}, \beta \neq 0
$$

$$
\begin{aligned}
& \text { (ii) } \frac{z+y}{21 x}=\frac{3 x}{z-y}=\frac{\alpha}{\beta}, \beta \neq 0 \\
& \text { (iii) } \frac{z+y}{3 x}=\frac{21 x}{z-y}=\frac{\alpha}{\beta}, \beta \neq 0 \\
& \text { (iv) } \frac{z+y}{x}=\frac{63 x}{z-y}=\frac{\alpha}{\beta}, \beta \neq 0
\end{aligned}
$$

Employing the procedure as above in each of the above representations, the corresponding solutions to (1) are presented below:

Solutions for ( $\boldsymbol{i}$ ):

$$
x=2 \alpha \beta, \quad y=7 \alpha^{2}-9 \beta^{2}, \quad z=7 \alpha^{2}+9 \beta^{2}
$$

Solutions for (ii):

$$
x=2 \alpha \beta, \quad y=21 \alpha^{2}-3 \beta^{2}, \quad z=21 \alpha^{2}+3 \beta^{2}
$$

Solution for (iii):

$$
x=2 \alpha \beta, \quad y=3 \alpha^{2}-21 \beta^{2}, \quad z=3 \alpha^{2}+21 \beta^{2}
$$

Solution for (iv):

$$
x=2 \alpha \beta, \quad y=\alpha^{2}-63 \beta^{2}, \quad z=\alpha^{2}+63 \beta^{2}
$$

## Method:2

(1)is written as the system of double equations in Table 1 as follows:

Table:1System of Double Equations

| System | I | II | III | IV | V | VI | VII | VIII |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $z+y=$ | $x^{2}$ | $3 x^{2}$ | $7 x^{2}$ | $9 x^{2}$ | $21 x^{2}$ | $9 x$ | $21 x$ | $63 x$ |
| $z-y=$ | 63 | 21 | 9 | 7 | 3 | $7 x$ | $3 x$ | $x$ |

Solving each of the above system of double equations, the values of $x, y \& z$ satisfying (1) are obtained .For simplicity and brevity, in what follows, the integer solutions thus obtained are exhibited.

Solutions for system: I

$$
x=2 k+1, \quad y=2 k^{2}+2 k-31, \quad z=2 k^{2}+2 k+32
$$

Solutions for system: II

$$
x=2 k+1, \quad y=6 k^{2}+6 k-9, \quad z=6 k^{2}+6 k+12
$$

Solutions for system: III

$$
x=2 k+1, \quad y=14 k^{2}+14 k-1, z=14 k^{2}+14 k+8
$$

Solutions for system: IV

$$
x=2 k+1, \quad y=18 k^{2}+18 k+1, z=18 k^{2}+18 k+8
$$

Solutions for system: V

$$
x=2 k+1, \quad y=42 k^{2}+42 k+9, z=42 k^{2}+42 k+12
$$

Solutions for system: VI

$$
x=k, \quad y=k, \quad z=8 k
$$

Solutions for system: VII

$$
x=k, \quad y=9 k, \quad z=12 k
$$

Solutions for system: VIII

$$
x=k, \quad y=31 k, \quad z=32 k
$$

## Method:3

Let $z=y+k, \quad k \neq 0$

$$
\begin{equation*}
\therefore(1) \Rightarrow 2 k y=63 x^{2}-k^{2} \tag{3}
\end{equation*}
$$

Assume

$$
\begin{align*}
& x=k(2 \alpha+1)  \tag{4}\\
& \therefore y=63\left(2 k \alpha^{2}+2 k \alpha\right)+31 k \tag{5}
\end{align*}
$$

In view of (3),

$$
\begin{equation*}
z=63\left(2 k \alpha^{2}+2 k \alpha\right)+32 k \tag{6}
\end{equation*}
$$

Note that (4), (5), (6) satisfy (1).

## Method:4

(1) is written as

$$
\begin{equation*}
y^{2}+63 x^{2}=z^{2}=z^{2} * 1 \tag{7}
\end{equation*}
$$

Assume $z$ as

$$
\begin{equation*}
z=a^{2}+63 b^{2} \tag{8}
\end{equation*}
$$

Write 1 as

$$
\begin{equation*}
1=\frac{(1+i \sqrt{63})(1-i \sqrt{63})}{64} \tag{9}
\end{equation*}
$$

Using (8)\& (9) in (7) and employing the method of factorization, consider

$$
(y+i \sqrt{63} x)=(a+i \sqrt{63} b)^{2} \cdot \frac{(1+i \sqrt{63})}{8}
$$

Equating the real\&imaginary parts, it is seen that

$$
\left.\begin{array}{rl}
x & =\frac{1}{8}\left[a^{2}-63 b^{2}+2 a b\right]  \tag{10}\\
y & =\frac{1}{8}\left[\left(a^{2}-63 b^{2}\right)-126 a b\right]
\end{array}\right\}
$$

Since our interest is to find the integer solutions,replacing a by $8 A \& b$ by $8 B$ in (10)\& (8), the corresponding integer solutions to (1) are given by

$$
\begin{aligned}
& x=x(A, B)=8\left[A^{2}-63 B^{2}+2 A B\right] \\
& y=y(A, B)=8\left[A^{2}-63 B^{2}-126 A B\right] \\
& z=z(A, B)=64\left[A^{2}+63 B^{2}\right]
\end{aligned}
$$

## Properties:

- $x(A, A+1)-y(A, A+1)=2048 t_{3, A}$
- $\left[x\left(\alpha^{2}, \alpha+1\right)-y\left(\alpha^{2}, \alpha+1\right)-64 t_{34, \alpha^{2}}\right]$ is 31 times a square.
- $8 y(A, A+1)+z(A, A+1)=64\left[t_{6, A}-252 t_{3, A}\right]$
- $8 x(A, A+1)+z(A, A+1)=64\left[t_{6, A}+4 t_{3, A}\right]$
- $4(x(A, A+1)+y(A, A+1))+z(A, A+1)=64\left[t_{6, A}-124 t_{3, A}\right]$

Note: 2
In addition to (9), 1 may also be represented as follows:

$$
\begin{aligned}
& \text { (v) } 1=\frac{(9+i \sqrt{63})(9-i \sqrt{63})}{144} \\
& \text { (vi) } 1=\frac{\left[\left(63 \alpha^{2}-\beta^{2}\right)+i \sqrt{63} \cdot 2 \alpha \beta\right]\left[\left(63 \alpha^{2}-\beta^{2}\right)-i \sqrt{63} \cdot 2 \alpha \beta\right]}{\left(63 \alpha^{2}+\beta^{2}\right)^{2}}
\end{aligned}
$$

For the above choices, the corresponding values of $x, y, z$ satisfying (1) are given below:
Solutions for (v):

$$
\begin{aligned}
& x=12\left[A^{2}-63 B^{2}+18 A B\right] \\
& y=12\left[9 A^{2}-567 A B-126 A B\right] \\
& z=144\left[A^{2}+63 B^{2}\right]
\end{aligned}
$$

Solutions for (vi):

$$
\begin{aligned}
& x=\left(63 \alpha^{2}+\beta^{2}\right)\left[2 \alpha \beta\left(A^{2}-63 B^{2}\right)+2 A B\left(63 \alpha^{2}-\beta^{2}\right)\right] \\
& y=\left(63 \alpha^{2}+\beta^{2}\right)\left[\left(63 \alpha^{2}-\beta^{2}\right)\left(A^{2}-63 B^{2}\right)-252 \alpha \beta A B\right] \\
& z=\left(63 \alpha^{2}+\beta^{2}\right)^{2}\left(A^{2}+63 B^{2}\right)
\end{aligned}
$$

## GENERATION OF SOLUTIONS

Different formulas for generating sequence of integer solutions based on the given solution are presented below:

Let $\left(x_{0}, y_{0}, z_{0}\right)$ be any given solution to (1)
Formula: 1
Let $\left(x_{1}, y_{1}, z_{1}\right)$ given by

$$
\begin{equation*}
x_{1}=x_{0}+h, y_{1}=y_{0}, z_{1}=-z_{0}+8 h \tag{11}
\end{equation*}
$$

be the $2^{\text {nd }}$ solution to (1).Using (11) in (1) and simplifying, one obtains

$$
h=126 x_{0}+16 z_{0}
$$

In view of (11), the values of $x_{1}$ and $z_{1}$ is written in the matrix form as

$$
\left(x_{1}, z_{1}\right)^{t}=M\left(x_{0}, z_{0}\right)^{t}
$$

where

$$
M=\left(\begin{array}{cc}
127 & 16 \\
1008 & 127
\end{array}\right) \text { and } t \text { is the transpose }
$$

The repetition of the above process leads to the $n^{\text {th }}$ solutions $x_{n}, z_{n}$ given by $\left(x_{n}, z_{n}\right)^{t}=M^{n}\left(x_{0}, z_{0}\right)^{t}$

If $\alpha, \beta$ are the distinct eigenvalues of $M$, then
$\alpha=127+48 \sqrt{7}, \beta=127-48 \sqrt{7}$
We know that

$$
M^{n}=\frac{\alpha^{n}}{(\alpha-\beta)}(M-\beta I)+\frac{\beta^{n}}{(\beta-\alpha)}(M-\alpha I), I=2 \times 2 \text { identity matrix }
$$

Thus, the general formulas for integer solutions to (1) are given by

$$
\begin{aligned}
x_{n} & =\left(\frac{\alpha^{n}+\beta^{n}}{2}\right) x_{0}+\left(\frac{\alpha^{n}-\beta^{n}}{6 \sqrt{7}}\right) z_{0} \\
y_{n} & =y_{0} \\
z_{n} & =\frac{21}{2 \sqrt{7}}\left(\alpha^{n}-\beta^{n}\right) x_{0}+\left(\frac{\alpha^{n}+\beta^{n}}{2}\right) z_{0}
\end{aligned}
$$

## Formula: 2

Let $\left(x_{1}, y_{1}, z_{1}\right)$ given by
$x_{1}=3 x_{0}, y_{1}=3 y_{0}+h, z_{1}=2 h-3 z_{0}$
be the $2^{\text {nd }}$ solution to (1).Using (12) in (1) and simplifying, one obtains

$$
h=2 x_{0}+16 z_{0}
$$

In view of (12), the values of $y_{1}$ and $z_{1}$ is written in the matrix form as

$$
\left(y_{1}, z_{1}\right)^{t}=M\left(y_{0}, z_{0}\right)^{t}
$$

where

$$
M=\left(\begin{array}{ll}
5 & 4 \\
4 & 5
\end{array}\right) \text { and } t \text { is the transpose }
$$

The repetition of the above process leads to the $n^{\text {th }}$ solutions $y_{n}, z_{n}$ given by

$$
\left(y_{n}, z_{n}\right)^{t}=M^{n}\left(y_{0}, z_{0}\right)^{t}
$$

If $\alpha, \beta$ are the distinct eigenvalues of $M$, then

$$
\alpha=1, \beta=9
$$

Thus, the general formulas for integer solutions to (1) are given by

$$
\begin{aligned}
& x_{n}=3^{n} x_{0} \\
& y_{n}=\left(\frac{9^{n}+1}{2}\right) y_{0}+\left(\frac{9^{n}-1}{2}\right) z_{0} \\
& z_{n}=\left(\frac{9^{n}-1}{2}\right) y_{0}+\left(\frac{9^{n}+1}{2}\right) z_{0}
\end{aligned}
$$

## Formula: 3

Let $\left(x_{1}, y_{1}, z_{1}\right)$ given by
$x_{1}=-64 x_{0}+h, y_{1}=-64 y_{0}+h, z_{1}=64 z_{0}$
be the $2^{\text {nd }}$ solution to (1).Using (13) in (1) and simplifying, one obtains

$$
h=126 x_{0}+2 y_{0}
$$

In view of (13), the values of $x_{1}$ and $y_{1}$ is written in the matrix form as

$$
\left(x_{1}, y_{1}\right)^{t}=M\left(x_{0}, y_{0}\right)^{t}
$$

where

$$
M=\left(\begin{array}{cc}
62 & 2 \\
126 & -62
\end{array}\right) \text { and } t \text { is the transpose }
$$

The repetition of the above process leads to the $n^{\text {th }}$ solutions $x_{n}, y_{n}$ given by $\left(x_{n}, y_{n}\right)^{t}=M^{n}\left(x_{0}, y_{0}\right)^{t}$

If $\alpha, \beta$ are the distinct eigenvalues of $M$, then

$$
\alpha=64, \beta=-64
$$

Thus, the general formulas for integer solutions to (1) are given by

International Research Journal of Education and Technology ISSN 2581-7795

$$
\begin{aligned}
& x_{n}=64^{n-1}\left(63+(-1)^{n}\right) x_{0}+64^{n-1}\left(1-(-1)^{n}\right) y_{0} \\
& y_{n}=63.64^{n-1}\left(1-(-1)^{n}\right) x_{0}+64^{n-1}\left(1+63(-1)^{n}\right) y_{0} \\
& z_{n}=64^{n} z_{0}
\end{aligned}
$$
